We believe every organization, regardless of size, should have access to the benefits of AI technologies to help them grow and compete. Small and medium-sized businesses across Spain can benefit from embracing these new technologies just as much as large organizations. We’re focused on helping firms of all sizes succeed by making AI technologies affordable, easy to access, and easy to use.

— Brad Smith, President and Chief Legal Officer for Microsoft
Human Ingenuity

The printing press, the automobile & the Internet are just a few technological achievements that have advanced our world. All were driven by human ingenuity: our innate creativity that inspires us to learn, imagine & explore. This spirit is what pushes us to challenge the boundaries of the possible to go ever forward.

Today, AI is helping to amplify our human ingenuity, opening up exciting new possibilities for how intelligent technology can shape our world. At Microsoft, our goal is to democratize access to AI for everyone through innovative & powerful platforms, & above all, we’re focused on ensuring that our AI tools & technologies are deployed responsibly & earn people’s trust.

And yet, we realize that AI is one of the lesser understood modern technological break-throughs. Many questions remain. How are companies applying this technology to empower employees, engage with customers, transform their business and optimize their operations? Where are they seeing benefits, and what are their blockers?

To provide answers, Microsoft commissioned this study to understand the AI strategy of major companies across 7 sectors & 15 countries in Europe. It examines these companies’ readiness to adopt AI, how they rate the impact and benefits from AI implementations, and what they perceive as risks & keys to success.

We hope you find these insights inspirational for your own journey toward adopting AI & realizing its benefits for amplifying human ingenuity.

Vahé Torossian
President, Microsoft Western Europe

The question is... when?

What do a telecommunications company with more than 120,000 employees around the world and a small winery located in the Galician Rias Baixas dedicated to the production and distribution of Albariño wine have in common?

The answer is that they both use Microsoft’s artificial intelligence technology to help advance their businesses. In the first case, AI technologies are allowing them to transform customer experience and improve user engagement. In the case of the winery, AI enables predictive analysis of information collected in the field to provide recommendations on how to improve wine production.

In Spain, we are already seeing numerous cases of organizations of all sizes that are exploring, developing pilots and proofs-of-concept, and deploying AI-based solutions, with a positive impact on their businesses.

In fact, one of the findings in this report is that 95% of Spanish companies believe that the implementation of AI solutions will optimize their operations, and 85% believe that AI will improve engagement with their customers.

AI is already a reality in Spain. The key question Spanish companies should be asking themselves is not “if?”, but “when?”.

Pilar López
President, Microsoft Spain
At a Glance

While the hype of artificial intelligence (AI) and its potential role as a driver of transformational change to businesses and industries is pervasive, there are limited insights into what companies are actually doing to reap its benefits. This report aims at getting a deeper understanding of how companies currently manage their AI activities, and how they address the current challenges and opportunities ahead.

To get to the heart of this agenda, we received input from AI leaders in 277 companies, across 7 sectors and 15 countries in Europe, via surveys and/or interviews. Below is the brief summary of what they had to say.

AI is a “hot topic” - but more so on C-level than in daily operations

71% of the companies respond that AI is considered an important topic on the executive management level. This is significantly higher than on the non-managerial / employee level where AI is only considered an important topic in 28% of the companies.

Interestingly, Board of Directors also came out lower with only 38% of respondents reporting that AI is important to their board.

Most impact expected from ‘optimizing operations’, with ‘engaging customers’ as a close second

89% of the respondents expect AI to generate business benefits by optimizing their companies’ operations in the future. This is followed by 74% that expect AI to be key to engaging customers by enhancing the user experience, tailoring content, increasing response speed, adding sentiment, creating experiences, anticipating needs, etc.

C-suite respondents scored ‘engaging customers’ highest of the AI benefit areas. Noticeably, 100% of the most advanced companies expect AI will help them engage customers, compared to only 63% of the less mature companies.

Using AI to ‘transform products and services’ comes out slightly lower with 65%, and ‘empowering employees’ the lowest with 60% of the companies expecting AI-generated benefits in that area.

AI is expected to impact entirely new business areas in the future

57% of the companies expect AI to have a high impact or a very high impact on business areas that are ‘entirely unknown to the company today’. This is almost as much as AI is expected to impact the core of these companies’ current business with 65% expecting AI to have a high or a very high impact on the core business. With AI presumably pushing companies into totally new domains in the future, it is perhaps not surprising that AI is receiving attention as a key topic for executive management.

Very few of the 277 companies consider themselves “advanced” with AI

Despite the apparent sizable impact that companies expect from AI, only a very small proportion of companies, constituting 4% of the total sample, self-report that AI is actively contributing to ‘many processes in the company and enabling quite advanced tasks today’ (referred to as ‘most advanced’ in this report).

Another 28% are in the ‘released’ stage where they have put AI selectively to active use in one or a few processes in the company. The majority, 51% of companies, are still only planning for AI or are in early stage pilots. 7% of companies are self-rated as least mature, indicating that they are not yet thinking about AI at this stage.

Noticeable potential for AI in many corporate functions

The most widely reported adoption of AI (47%) was in the IT/Technology function, followed by R&D with 36%, and customer service with 24%. Interestingly, several functions are hardly using AI at all; most notably, the procurement function, where only 4% of the companies currently use AI, followed by HR with 7% and product management with 9%. This is perhaps surprising, given the many use cases and applicable solutions in these functional areas.

8 key capabilities that are most important to get AI right

When asking the respondents to rank the importance of 8 capabilities to enable AI in their businesses, ‘advanced analytics’ and ‘data management’ emerged as the most important ‘AI leadership’ and having an ‘open culture’ followed.

When self-assessing the capabilities where the companies are least competent, they point to emotional intelligence and AI leadership - defined as the lack of ability to lead an AI transformation by articulating a vision, setting goals and securing broad buy-in across the organization.

To summarize, the challenge ahead appears to be as much about culture and leadership as it is about data, analytics, and technology.

Spanish companies beginning to explore possibilities with AI

When looking across the 20 companies that have participated in the study in Spain, it is clear that they are actively exploring and pursuing possibilities with AI, yet falling behind with regards to current AI maturity (20% of the Spanish companies have deployed AI beyond early stage pilots vs. 32% on average for their European peers). Despite the lower level of maturity, 70% of Spanish companies report that AI is currently considered an important topic at the C-suite level and that AI is as important as other digital priorities, if not more important. Expected impact is high as well: the vast majority of companies from Spain report expecting AI to create some degree of impact across all business areas – core, adjacent and new.

What sets the most ‘AI mature’ companies apart?

They expect AI will be beneficial in ‘empowering employees’ (76% of ‘more mature’ companies vs. 42% of ‘less mature’ companies)*.

They report using a combination of structured and unstructured data for AI (65% of ‘more mature’ companies vs. 15% of ‘less mature’ companies), and data from both internal and external sources (68% of ‘more mature’ companies vs. 16% of ‘less mature’ companies).

They expect AI will help them ‘engage customers’ (85% of ‘more mature’ companies vs. 59% of ‘less mature’ companies).

They see AI predominately being driven from a combination of technology push and business pull (67% of ‘more mature’ companies vs. 32% of ‘less mature’ companies).

* ‘More mature’ defined as companies that self-ranked as 4 or 5 on the maturity 5-scale, and ‘less mature’ defined as companies that self-ranked as 1 or 2.
Artificial Intelligence (AI) is not new. It has existed for decades: processing voice to text or language translation; real-time traffic navigation; dynamically serving targeted advertisements based on personal data and browsing history; predicting trends and guiding investment decisions in financial institutions. The current developments have been fueled by an exponential rise in computing power, increasing accessibility and sophistication of powerful algorithms, and an explosion in the volume and detail of data available to feed AI’s capabilities.

Reality vs. hype

Only recently started to see more widespread, scaled adoption of AI across sectors, value chains and ecosystems. Yet AI technology is quickly approaching a point where it is becoming a critical element in enabling companies across sectors to drive revenue, increase profits and remain competitive.

We hear many people in numerous companies talk about AI. While the hype is pervasive, not a lot of people fully understand its technological potential, where it can create value or how to get started. This report aims at providing a practical understanding of why European companies are investing in AI, what they are investing in, and how they are managing the complicated process of adopting this new technology and deriving value across business opportunities.

Perspectives, experiences, self-assessment, and benchmarks

From new surveys, interviews and case studies gathered from approximately 277 companies, we provide a snapshot of the current state of AI in 15 European markets. This includes analyzing AI’s relative importance on the strategic agenda, its expected impact and benefit areas, how mature companies are in terms of adoption, and examining self-reported competence levels regarding the capabilities required to succeed when implementing AI.

From the aggregate dataset we have been able to determine some benchmarks across the covered markets, which we compare the individual country with throughout the report. The report also covers a full spectrum of industry groups which tend to reveal interesting insights.

About this Report

What’s new?

Artificial Intelligence (AI) is already changing the way we approach the operation in some of our business units, so is a present tool used to support current business. It’s also been a positive factor in bidding processes and in the creation of new business lines.

— Ferrovial Infrastructure company

AI is both a strategic and important business topic for the company today; the decision-making process in terms of consumer focus, investments and institutions is key when entering this field.

— Campbells International Food company

Straight from the executives

Where this report and extensive dataset adds new insights is primarily into how leading companies are approaching AI on a very practical level. We hear straight from executives how their companies are addressing current challenges, and how they apply AI to unlock new value pockets.

Based on the many interviews conducted, this report reveals some clear excitement and immense potential for using AI to bring new, improved products and services to market, create exceptional experiences for customers and employees, and create ways to operate that enhance performance across the board.

We learned that regardless of which use cases the companies pursue and the role that AI currently has, taking a strategic outlook to assess the implications for the business and responding accordingly are increasingly seen as crucial for any executive agenda.

Contributions from open-minded and collaborative companies

We are extremely thankful for the time and effort the many executives have put into participating in interviews and providing data for this study. We’re particularly appreciative of their willingness to openly share experiences and provide their perspectives on where the future is heading within AI.

While this indicate a general interest in the AI topic, it also speaks to the increasingly collaborative approach many leading companies are taking when entering new technology domains and embarking on journeys into unknown territories.

— Ferrovial Infrastructure company
This report combines multiple sources of data to answer the questions of why, where and how AI is currently being used in business. It provides an inside view across markets and sectors. It combines local and pan-European views, and adds value through a quantitative perspective on how advanced companies are with AI, and a qualitative perspective on how to develop the skills required to succeed with AI. We have received input from over 300 people from 277 participating companies. This has resulted in a range of interviews and case studies as well as 269 company responses to our survey.

We have surveyed people with a leading role in managing the AI agenda in all the companies that have contributed to the study. This gives us an aggregate dataset that enables a perspective for each market and each sector, as well as comparative insights for the respective company types, sectors, and countries in Europe.

In terms of methodology, this report follows robust research design and protocol. Doing so minimizes potential bias, but does not eliminate it, as it is inevitable in market research. One potential type is social desirability and conformity bias, as the topic of AI receives lots of media and political attention. Response bias, including extreme responding, cultural bias, and acquiescence bias (“yea-saying”), are potential factors as we ask respondents to self-report on their respective companies’ experience. Therefore, while this report follows best practices, some bias is possible.

Nonetheless, with the combination of extensive survey data, interview data, investment data, and expert perspectives, we believe the report provides a solid foundation for an indispensable view of executive experience with – and future plans for – AI in business.

**Rich Data**

Which sources of information is the study based on?

This report combines multiple sources of data to answer the questions of why, where and how AI is currently being used in business. It provides an inside view across markets and sectors. It combines local and pan-European views, and adds value through a quantitative perspective on how advanced companies are with AI, and a qualitative perspective on how to develop the skills required to succeed with AI. We have received input from over 300 people from 277 participating companies. This has resulted in a range of interviews and case studies as well as 269 company responses to our survey.

We have surveyed people with a leading role in managing the AI agenda in all the companies that have contributed to the study. This gives us an aggregate dataset that enables a perspective for each market and each sector, as well as comparative insights for the respective company types, sectors, and countries in Europe.

**Extensive online survey data from business leaders in 269 companies**

We have surveyed people with a leading role in managing the AI agenda in all the companies that have contributed to the study. This gives us an aggregate dataset that enables a perspective for each market and each sector, as well as comparative insights for the respective company types, sectors, and countries in Europe.

**Qualitative in-depth interviews with senior business executives**

In addition, we conducted deep-dive interviews to gain deeper, qualitative insights into how AI is affecting the executive agenda. Through conversations with business leaders, we report on where they expect AI will have an impact, how important AI is to their current and future business strategies, what benefits they hope to realize from implementing AI, and which capabilities they believe are key to advance AI maturity in their companies.

**Proprietary AI investment data**

We have supplemented the primary source input from the companies with acquisition data from numerous sources, to take the pulse of the AI investment market in Europe. These insights help provide a picture of the wider European AI ecosystem and its development.

**AI expert perspectives**

With this wider understanding of AI start-up acquisitions, partnerships, and investment funding, we outline how investments in AI are skyrocketing, where AI investment is taking place geographically, and which sectors are making bets. As we are on the cusp of widespread change driven by AI, we also reached out to AI experts from academia for an outlook of AI technologies going mainstream, and to gain an understanding of the macro scale of business effects that they expect will materialize when looking into a distant future.

**Recognizing and mitigating potential survey and interview bias**

In terms of methodology, this report follows robust research design and protocol. Doing so minimizes potential bias, but does not eliminate it, as it is inevitable in market research. One potential type is social desirability and conformity bias, as the topic of AI receives lots of media and political attention. Response bias, including extreme responding, cultural bias, and acquiescence bias (“yea-saying”), are potential factors as we ask respondents to self-report on their respective companies’ experience. Therefore, while this report follows best practices, some bias is possible.

Nonetheless, with the combination of extensive survey data, interview data, investment data, and expert perspectives, we believe the report provides a solid foundation for an indispensable view of executive experience with – and future plans for – AI in business.

**HR should be reorganized because some of the jobs that are being done nowadays will be driven by AI in the future, so the company should face this challenge to update skills and making this transformation day by day.**

— Acciona Infrastructure company

**The challenge is that AI will be available in many different places so you will need to manage all AI and machine learning in all your products and services. It is not in one place or one function, it is all over the place.**

— Ericsson Telecommunications company
Executive Perspective

Who are the respondents that have contributed to the study?

The data approach used allows us to identify trends across industries and countries based on input from various functional business areas. Consequently, we have captured a range of insights, learnings, and perspectives from both strategic and technical points of view.

Respondents predominantly in senior level positions

To ensure that these insights and perspectives are relevant at the executive level, we surveyed and interviewed high-ranking officers with a responsibility for driving the AI agenda in their respective companies. With 60% of respondents being either part of top management or the executive management team, their input is likely well attuned to the general perspective and overall strategic direction of the companies they represent.

Functional diversity

The respondents cover very different functions, of which the most common are designated AI/digital department, followed by IT, and strategy/general management functions. This functional diversity increases the breadth of the report, with insights and perspectives covering widely different aspects of AI.

Surveyed companies span multiple sectors

The participating companies are spread fairly evenly across seven sectors, with the majority of companies belonging to Industrial Products & Manufacturing, followed by Financial Services, and Transportation, Energy & Construction. Services and Life Science are represented to a lesser extent.

A combined annual revenue of $1.9 trillion

Participants come from both major listed companies, privately held companies, and in some case relatively small companies. In totality, they represent a combined revenue of approximately $1.9 trillion. Despite covering a significant part of total European business, our selection criteria have also favored more niche oriented companies with extensive AI experience and capabilities.

More than 300 participants

Number of participants interviewed and/or online surveyed in the study

25 of +300 are Spanish participants

Majority hold a top management or executive position

Organizational level of person participating in the study

C-suite/Executive 27%
Top Management (non-executive) 11%
Management Level 17%
Employee (non-managerial level) 3%

Biometrics

Companies are using a combination of on-premise and cloud solutions

Companies are increasingly using cloud-based AI solutions for both storage and on-demand computing power. 83% of companies reporting using Cloud technology to some extent to enable their AI capabilities. Key benefits of cloud solutions mentioned by many respondents are the flexibility to swiftly scale systems up and down to accommodate changing demand, a variable cost structure, and access to larger data sets. However, many companies are still relying on on-premise solutions, not least due to existing data infrastructure.

Machine learning and smart robotics most useful for Spanish companies

On average, the underlying technologies that are most useful for Spanish companies are concentrated in two areas: machine learning (65%), and smart robotics (40%). Additionally, in Spain speech recognition ranks considerably higher than the European aggregate (35% vs. 21%) Overall, the AI technologies have a lower share in Spanish companies compared to the European aggregate.

Setting the Scene

What technologies and data solutions are within the scope of the study?

A broad definition of technologies are included in this AI definition

Techologies included in the definition of AI used in this study:

- **Natural Language Processing**: Computer interpretation, understanding, and generation of written natural human language.
- **Virtual Agents**: Computer-generated virtual personas that can be used to interact with people in both B2C, C2B, and B2B contexts.
- **Speech Recognition**: Enables computers to interpret spoken language and to transform it into written text or to treat it as commands for a computer.
- **Smart Robotics**: The combination of AI and robots to perform advanced tasks compared to traditional non-intelligent robots.
- **Text Analysis**: Computational analysis of texts, making it readable by other AI or computer systems.
- **Biometrics**: Analysis of human physical and emotional characteristics – used also for identification and access control.
- **Machine Learning**: A computer’s ability to learn from data, either supervised or non-supervised.
- **Neural Networks and Deep Learning**: Machines emulating the human brain, enabling AI models to learn like humans.
- **Computer Vision**: Given computers the ability to “see”, images similar to how humans see.

Companies are using a mix of Data Sources and Storage

1. Are you currently using unstructured or structured data types in your AI process?
2. Are you currently using internal or external data sources in your AI process?

Follow the Money

How much is invested in AI in Europe?

A few big AI transactions influencing the overall picture
Company AI investments in mUSD and transaction volume per market (accumulated 2008-2018)

The acquisition data from numerous sources enabled us to explore the European AI ecosystem and gain insights into investment activity.

An exponential increase in AI investment over the past decade
Looking at AI transaction activity across Europe, there has been a steep consistent growth trend over the past 10 years, totaling 1,334 transactions involving AI by 2017 – with a six-fold increase in activity in the last 5 years alone. This trend is on track to continue, with an exponential increase in interest in AI driving more large companies to invest in AI or acquire AI capabilities from innovative start-ups. Of the 15 markets surveyed, some include one or two transactions that are significantly large deals.

Majority of investments in AI from private equity and venture capital
Private equity (PE) and venture capital (VC) firms are significantly more active investors and acquirers of AI than corporates, accounting for 75% of deal volume in the last 10 years. This is an indication that AI companies are in the early stages of high-risk/high-growth dynamics. It also indicates that, for large corporates, acquiring or investing in external AI businesses in order to obtain AI capabilities is relatively limited. This is confirmed by our survey results where only 10% of companies are seeking to obtain needed AI capabilities through external investment or acquisitions, and is also much in line with what we’re seeing when comparing with the US and Asia.

Investment activity concentrated in major European markets
It comes as no surprise that a lot of investment activity is in the UK, France, and Germany, having attracted 87% of investment in AI companies over the past decade. The UK leads significantly in this regard, with $33 of the total 1,362 AI transactions in Europe. From an investment perspective, it is also worth noting that in April 2018, the EU committed to a 70% increase in investment in European AI by 2020, suggesting further growth and potential in the region.

Over $131 million invested in AI start-ups in Spain in the past decade
In Spain, there were 79 transactions over the past decade involving companies working with AI. Of these, 36 reported deal value totaling $131 million. Two of the largest transactions in Spain, totaling $54 million, were investments from the Telecom, Media & Technology sector. Of the AI companies in Spain that received investments or were acquired, 47% focus primarily on machine learning technology, likely due to its wide applicability across a range of business problems and sectors.

Note: Several transactions in the dataset did not have publically disclosed deal values, suggesting that actual total values are higher than what’s shown above.
Acciona

As a major player in the infrastructure development and management industry, Acciona understands that constant innovation is key to remaining ahead of its competitors; it has therefore begun implementing several types of AI into its daily operations. Acciona’s use of Artificial Intelligence tools has already made itself apparent enabling them to receive funding from Spain and the European Union to further expand their AI initiatives. A big challenge in the early stages of AI adoption is to get buy-in from the people in Acciona’s different divisions. However, the Spanish infrastructure group has made significant efforts in innovation related projects, both in-house and together with strategic partners, such as incorporating AI in an effort to increase energy harvested from solar power plants, to advanced tools that predict power fluctuations throughout energy grids to prevent collapse.

AI is being used to make predictive analyses to reduce employee workload and eliminate unexpected issues concerning daily operations.

To foster learning and innovation, Acciona has opened a start-up program in which it works alongside tech companies and start-ups to address the challenges arising from digital disruption. Acciona has also developed an in-house innovation program, called the Advanced & Digital Innovation Hub, comprising a number of Skill Centers. A recent innovation project surrounded the elimination of anomalies in hydro power stations, where AI is being used to make predictive analyses to reduce employee workload and eliminate unexpected issues concerning daily operations. AI tools will not only make Acciona’s organizations more efficient and improve decision-making processes, but also contribute to the group’s ultimate goal of reducing environmental impact of its work and improve its sustainability profile.

What next?

Acciona seeks to continue to be a relevant agent in the infrastructure construction and management industry and build upon AI capabilities as it becomes increasingly pertinent to their market and operating environment. Focus on innovation and digital tools is playing a growing role in remaining competitive in the burgeoning renewable energy industry, where priorities include increased use of AI-driven technologies, from predictive analytics, active monitoring capabilities, back office support for operational efficiency and enhanced connectivity technologies.

At Acciona, we focus on innovation and on improving our business with the latest technologies available — we are convinced that AI tools can help us to continuously improve our business.

Agile culture enables AI

Culture was a recurring theme as well. It can either stifle forward momentum in organizations, or be the silver bullet that enables the potential of AI to be realized from top to bottom. Some of the experts even argue that it’s not only technical skills that hold up AI projects, it’s also the need for a culture of experimentation.

Companies that are more natively digital or have gone down that road understand the value of experimenting and iterating. They don’t think in traditional terms of committing to year-long projects that need to produce specific outputs, but rather to explore and test ideas before scaling.

When it comes to AI, knowledge is power

Expert opinion also seemed unanimous in that most people not directly involved with AI must still have quite a basic understanding of what AI is and what it can actually do. Therefore, the task is to educate and improve understanding, from C-suite leadership teams to employees at the coal face. This also ties in with the importance of partnering to get started and access the expertise needed to use AI. While partnering and collaborating solves the perennial AI challenge concerning the scarcity of talent, the significant cost and substantial benefit that can be gained from AI means that organizations also need to be cognizant of building capabilities in-house for the long-term.

Finally, as AI develops, we are also going to see innovation and expertise spreading outside of the dominant clusters of the likes of Silicon Valley, as governments, businesses and universities increasingly invest in building knowledge, resources and capabilities.

Artificial intelligence in Europe

Setting the Scene

22

— Royal Agrifirm Group
Agricultural cooperative

23
From the highest authority

The full extent of the AI story remains in its early stages. What we do know is that big data, computing power and connectivity are changing the industrial landscape. The opportunity rests in accelerating the digitization of businesses, making them more data driven by building applications that deliver machine-assisted insights.

— Mona Vernon, CTO, Thomson Reuters Labs

In some cases, there is too much hype, but paradoxically, the potential opportunities and benefits of AI are still, if anything, under-hyped. Often, the impact of new technologies is overestimated in the short term and underestimated in the long term, and while there is a lot of noise regarding AI, there’s been a lack of in-depth discussion and analysis of how it’s actually going to transform businesses.

— Nigel Duffy, Global AI Innovation Leader, EY

We believe that every organization is going to have to write their own AI manifesto: what they believe about AI, how they’re going to use or not use data, how they’re going to publish data, and make the consumers of their products and services aware of that. The creation of those manifestos is going to become a gateway to the success of AI.

— Norm Judah, Chief Technology Officer of Worldwide Services at Microsoft

If you have a ton of data, and your problem is one of classifying patterns (like speech recognition or object identification), AI may well be able to help. But let’s be realistic, too: AI is still nowhere near as flexible and versatile as human beings; if you need a machine to read, or react dynamically, on the fly, to some kind of ever changing problem, the technology you seek may not yet exist. Intelligence is a really hard problem.

— Gary Marcus, Founder & CEO, Geometric Intelligence [acquired by Uber] professor, NYU, contributor to The New Yorker and The New York Times

AI is a general purpose technology, so will eventually affect all industries. However, this impact can be slowed by the lack of data in particular industries. There’s also more innovative cultures inside different organizations, that can either drive adoption or prevent it.

— Marc Warner, CEO, ASI Data Science
Role of AI in European Business

There is a lot of hype surrounding AI at the moment, and few doubt its potential. We examine how important is AI compared to other digital priorities and where AI fits on the strategic agenda.

We look at the impact of AI on the company’s core business, as well as adjacent and new areas of business.

We also examine the current AI maturity levels across sectors and markets, the potential drivers for deploying AI, and where AI is applied within organizations, across customer-facing functions, operations, product development, and internal business support.

A Strategic Agenda

Where is the AI conversation currently taking place?

A good starting point to understand how large European companies are handling AI is to look at who in the organization is driving the AI agenda, whether it be the Board, the C-suite, managers, or employees.

AI is particularly relevant at higher organizational levels

From driving strategic considerations at the Board level to being a topic of interest or concern at the employee level, the results are clear: AI is important and resides across all levels at many of the organizations we interviewed.

Only a few companies stated that AI is not currently an important topic at any level of the organization - while the vast majority of companies view AI as generally important regardless of how advanced they are, or how much AI is being considered for deployment in the near future.

Active C-suite and Board of Directors involvement

In 71% of the companies surveyed, AI is already an important topic on the C-suite agenda and across various roles - from cost-focused CFOs looking for efficiency through automation, to CDOs with customer-oriented ambitions as part of wider digitalization efforts, to the CTOs who is often still responsible for a type of AI Center of Excellence.

Companies more advanced in AI tend to have stronger involvement of the C-suite and the Boards of Directors than the rest. They focus less on the technology itself and more on the business problems that AI can address.

Relatively speaking, the AI topic seems to not yet having reached the same level of importance at the non-managerial level (employees) than at the top. Speculating about the reason, it could both pertain to job insecurity and to the fact that AI is still a highly abstract topic for many when it comes to proving day-to-day business value.

AI an important topic among executives in Spain

In Spain, AI is an important topic across most levels of the organization. This is particularly the case at the C-suite level, where 70% of Spanish companies surveyed report that AI is an important item on their agenda. These results reflect the findings from executive interviews regarding top management’s role in fostering and sponsoring AI initiatives across the organizations.

AI is an important topic on the C-suite level in particular

On what hierarchical levels in your company is AI an important topic?

**Among Friends**

**What is the importance of AI against other digital priorities?**

In a business era driven by innovation and tech-led disruption, AI is obviously not the sole priority.

**AI as a digital priority**

When asked on a scale of 1 to 5 how important AI is to the business relative to other digital priorities, the majority of respondents told us that it is about equal. Very few organizations said it was their most important digital priority, or not formalized as a digital priority at all, with the spread of responses leaning slightly towards the upper end of the importance spectrum.

This slant is likely to increase as many companies expect AI to become more important, as the technology develops and use-cases become more clear to companies.

The participating companies are generally in the process of understanding the potential of existing data, including to what extent it can be used, what it can be used for, and how to capture and leverage it.

Furthermore, many of the companies are focused on building the appropriate data infrastructures or modernizing legacy systems as a top digital priority, both being prerequisites for introducing AI into the company. Considering that AI is heavily reliant on data as its fuel, this development suggests that the foundations are being laid for further AI integration in the years to come.

**AI seen as relatively important vs. other digital priorities in Spain**

More companies surveyed in Spain are engaging in successful pilot projects and proofs of concept, or have AI initiatives that are released into production. When it comes to their prioritization, Spanish respondents on average consider AI to be an important topic among many digital priorities. Some Spanish companies indicate that AI is embedded within their digital transformation initiatives, and hence it is very difficult to separate it from other digital priorities. Although AI is not the highest digital priority, companies in Spain are taking the steps necessary to move their AI initiatives forward.

---

**Push or Pull**

**How is AI predominately deployed into the organizations?**

To understand the drivers behind the adoption and deployment of AI in the companies, we took a closer look at how AI is approached in a top-down or bottom-up management context, and from a functional tech-vs.-business driven dynamic.

**AI driven from a combination of technology push and business pull**

The contributing companies are quite evenly split across deploying AI as a top-down process, as a bottom-up, or as a combination of the two. However, when looking at the self-reported most advanced companies, they are more top down than bottom up in their approach. It was clear from speaking with them, that this is partly a result of AI being increasingly important in the company, and playing an increasingly significant role in the overall strategy.

**AI driven from a combination of technology push and business pull**

According to a large part of the companies, and despite still being a technologically complex thing that requires many specially skilled employees, AI is most often deployed as a combination of business pull and technology push.

This resonates well with one of the most consistent inputs from the executives on the most sought after AI profiles which centered in on the hybrid profile that understand the business needs and the ability to match them to the technological possibilities.

---

**AI managed top-down in Spanish companies**

Among Spanish companies surveyed, AI deployment is driven by both pull from the business needs as well as push from IT’s capabilities and innovations. In addition, 50% of companies in Spain use a top-down approach to manage AI while only 15% use a bottom-up approach. This outcome is consistent with the results showing that AI is particularly important at the executive level for Spanish companies.

**AI deployed and managed in a balanced way**

How would you characterize the way AI is being managed in your company? How would you characterize the way AI is being deployed in your company?

---

Note: Remaining percent ‘Don’t know’ responses

---

**15 European markets**

**Spain**
**Ready, Set...**
What is the maturity of AI in different sectors?

While working with AI should be considered a continuous journey, the AI maturity of surveyed companies provides a tangible indication of the level of advancement of current initiatives.

**Multiple use cases, limited scalability and advanced use**
The majority of companies have begun exploring use-cases, while some companies have made early investments with the intention of taking a leading position in AI. The levels of advancement also vary in that some companies are focusing on narrow use-cases to support their existing business, while others are taking an explorative approach. Among the small group of companies with no or only little AI activity to date, several respond that they are planning to drastically ramp up efforts soon.

**Technology immaturity and internal data quality are key obstacles**
Many companies that have already implemented AI initiatives in their businesses are seeing tangible benefits. Consequently, many of them are exploring more use-cases and structuring their learnings from previous AI projects into a modus operandi that can speed up new initiatives.

Meanwhile, a substantial number of companies have intentionally chosen to take a ‘follower’ position, reporting the perceived immaturity of AI technologies as a key reason. Another reported obstacle to rolling out broader AI initiatives are root data in data and data infrastructure, where companies have separate projects aimed at improving the structure of existing data, collection of new data, and data access in general. However, the trend is clear: AI maturity is on the rise as adoption of key technologies accelerates and internal capabilities grow.

The vast majority of European businesses are currently either conducting pilot projects to test selected use-cases, or have commenced implementing AI in the business. When talking with executives, it is evident that many companies are struggling with how to integrate pilot projects into daily operations.

**Clear sector patterns, with TMT, Services, and Finance on top**
Companies currently leading the way in terms of AI maturity are in TMT, Services & Hospitality, and Financial Services. In those sectors, they gravitate towards grading their AI maturity as ‘Released’ (AI in active use, though selectively or not with very advanced tasks), or ‘Advanced’ (AI actively contributing to many processes and enabling advanced tasks). A logical explanation for the maturity in TMT and Finance is their tendency to be digitally advanced and more savvy with analytics, favoring these companies to progress beyond piloting by having data science capabilities in place to evolve towards more advanced AI stages.

**Infrastructure and IP with relatively many projects in ‘piloting’ phase**
The Infrastructure and Industrial Products sectors both stand out as having no companies responding that they are ‘Advanced’ in AI at this stage.

This indicates slower technology adoption lead times in these slightly more conservative sectors. Yet, with 74% of companies being in the ‘Piloting’ or ‘Released’ phases, the Infrastructure sector also seems to be evolving onto more advanced AI maturity.

**Life science and CPR have fewest released projects**
Consumer Products & Retail companies have a broad spread in terms of AI maturity, with 25% stating they have no plans at present for how and when to use AI – much higher than other sectors – while others in the same sector are already at the ‘Released’ or ‘Advanced’ stage of AI maturity. Several companies in both Consumer Products & Retail and Services & Hospitality cite the challenges of knowing what relevant AI technologies are available, utilizing unstructured data, as well as affording the payback period where there may be large upfront costs and undetermined returns on investment.

When talking about AI it is important to have a clear idea on the investment strategies.

— Campbells International Food company

---

**TMT sector with largest percentage of companies that are either released or advanced**

How would you describe your company’s general AI maturity? Sectors arranged by maturity based on Advanced and Released.
AI Maturity Curve

Majority of companies are in the ‘Piloting’ or ‘Released’ stage

We asked companies to self-report their current AI maturity level, grading themselves at None, Planned, Piloting, Released, or Advanced - as defined below.

**LEVEL OF MATURITY**

**Advanced**
AI is actively contributing to many processes in the company and is enabling quite advanced tasks.

**Released**
AI is put to active use in one or a few processes in the company, but still quite selectively, and/or not enabling very advanced tasks.

**Piloting**
AI is put to active use, but still only in early stage pilots.

**Planned**
AI is being planned, but not yet put to active use, not even in early stage pilots.

**None**
Not yet thinking about AI.

---

Spanish companies have initiated their AI journey

In terms of AI maturity, the majority of Spanish companies surveyed are planning or conducting pilot projects. However, only 20% report to have either released AI processes or reached an advanced stage with AI, and 15% of the companies surveyed are not yet thinking about AI. These findings imply that although most Spanish companies are experimenting with AI, there is still some work to be done before reaching full maturity. The interviews confirm that many companies are still developing Proofs of Concept, gathering the data and tools, and considering how best to capitalize on them.

AI most commonly applied in IT & R&D functions
Which of your company’s business functions currently use AI?

Looking at the business functions that most commonly use AI provides a good indication of where companies are placing their bets. These functions are driving the company AI agenda, influencing the future direction of the company’s AI efforts.

Many AI in R&D and IT/Digital functions
On top of an expected high prevalence of AI within IT departments, AI is also commonly used within R&D functions. This primarily comes down to three factors: employees in R&D are often engineers who tend to have a good understanding and appreciation of AI; the R&D function is often already wired towards taking an experimental, agile approach which is key to AI; and the R&D function often sits on significant amounts of useful data leading to high potential use-cases.

Online customer interactions generating front-end data
Customer-facing, commercial functions such as Marketing, Sales and Customer Service are also heavier users of AI, partly driven by their digitization levels. Although AI is generally adopted more slowly in customer facing interactions than in back-end functions, the abundance of data from increased use of online channels is expected to make these functions obvious candidates for AI technologies in the future. Operations and back-end functions use AI to increase efficiency by automating processes and informing decision-making. The key enabler is data infrastructure, and many companies – currently limited by legacy systems and processes that impede capture and retrieval of data – need to upgrade their infrastructure.

Limited use in HR and Procurement
There are several functions where AI is hardly in use among the participating companies. This includes people-intensive functions such as HR and Procurement. This is not due to lack of potentially valuable AI use-cases, which in the case of HR include talent acquisition (avoiding human bias), onboarding (Q&A), performance evaluation (analyzing data), etc. but rather seems to be a result of prioritizing other functions and priorities first.

Online customer interactions generating front-end data
Customer-facing, commercial functions such as Marketing, Sales and Customer Service are also heavier users of AI, partly driven by their digitization levels. Although AI is generally adopted more slowly in customer facing interactions than in back-end functions, the abundance of data from increased use of online channels is expected to make these functions obvious candidates for AI technologies in the future. Operations and back-end functions use AI to increase efficiency by automating processes and informing decision-making. The key enabler is data infrastructure, and many companies – currently limited by legacy systems and processes that impede capture and retrieval of data – need to upgrade their infrastructure.

This is not due to lack of potentially valuable AI use-cases, which in the case of HR include talent acquisition (avoiding human bias), onboarding (Q&A), performance evaluation (analyzing data), etc. but rather seems to be a result of prioritizing other functions and priorities first.

AI mostly applied in IT, Technology & Digital, Operations & Logistics and Customer Service in Spain
Among companies surveyed in Spain, usage spans 13 business functions and follows. The distribution of AI usage across business functions within companies surveyed in Spain is concentrated in three areas: IT, Technology & Digital (50%), Operations & Logistics (40%), and Customers Service (35%). The utilization of AI is considerably high within Strategy (20%) and Operations & Logistics (40%) compared to the European aggregates.

We are applying AI in some selected areas related to consumer experience, but wide-ranging ambitions are emerging across our value-chain. Currently, we are defining the future data architecture as a foundation for extensive use of AI.

— LEGO
Toy company
Globalia sees Artificial Intelligence as a strategic asset for companies doing business in the tourism sector. As customer habits evolve, customer experience becomes a key differentiator when contracting with one touristic operator or another. It is therefore crucial for Globalia to be able to foresee customer needs ahead of its competitors, and the only means to effectively do this is through leveraging Big Data and AI tools. Globalia is willing to continue driving necessary change, developing AI projects aiming to improve customer experience on several levels, for example by reducing response times in call centers and using chatbots to offer smart self-service solutions.

A proactive attitude regarding business intelligence allows Globalia to achieve higher efficiency, as gaining deeper customer insights has a direct impact on the company’s sales effectiveness. Globalia understands that digital disruption requires the whole organization to change as all functional areas within the company will be affected by increasingly working with AI. Thus, digital transformation is far from being a simple task for Globalia, as it implies change on many levels, not all of them technological.

The biggest challenge for the Spanish tourism operator remains to intelligently combine technology and business to deliver excellent customer service. Globalia is aware of the potential AI has in the tourism industry, and is consequently taking the path towards embracing technology together with strategic allies.

Globalia is a major Spanish tourism group, with presence in over 30 countries. It is the only completely integrated tourism company in Spain, offering a wide range of services to various types of customers. It operates an airline, Air Europa, with a fleet of over 50 aircrafts. It also has a network of over 800 travel agencies in Spain under well-known brands such as Halcón Viajes and Viajes Ecuador. Globalia also markets tourism packages through its wholesale division. Globalia employs over 14,000 people globally and its revenue for 2017 was €3.7 billion.

Service and customer experience means everything. Our main focus when we set up AI tools is to provide our customers with the best experience, even if it implies changes in all areas of the organization.

In the tourism industry you have to go further to succeed, that means getting to know customers’ needs before our competitors. Nowadays, that can only be achieved through Big Data and AI tools.

What next?
Globalia is aware of the potential of AI and Big Data in the future of the tourism industry, and is prepared to adapt its entire organization and functional structure to embrace technological changes. Analyzing Big Data will play a central role in Globalia’s efforts to thoroughly understand its customers and adapting its product offerings to their needs. Furthermore, continuous use and development of AI tools allow Globalia to deliver best-in-class customer experience, which is a key driver for growth within tourism.

As a number of industries are beginning to reap the benefits of AI, we investigate what AI is actually doing for businesses today and what is expected in the future.

We look at how big an impact executives expect AI will have in terms of driving growth or causing disruption in their industry, and examine AI’s basic and more advanced uses - highlighting examples of these functionalities in operational mode.

We also present a strategic approach to understanding AI’s four benefit domains from a business perspective, summarizing the value executives expect to generate by using AI, and touching on what business leaders see as the most prevalent business risks.
Another World

What is the expected impact from AI within the next 5 years?

Of the surveyed companies, 81% believe that AI will have a high or significant impact on their industry within the next five years. Digging deeper into the data, many of these companies expect AI to fundamentally change their competitive landscape, driven by increasing risk of competition, including from new types of start-ups and companies from adjacent industries. The majority of companies also believe that AI will play a key role in their efforts to continuously cut costs to stay competitive.

Countries expect different impact from AI

When approaching impact from a country perspective, the tendency remains: very high expectations across the board. Portugal stands out with most ‘high’ impact responses.

In the opposite end of the expected impact scale, Ireland, Austria in that order, are the countries where most companies expect only ‘some’ impact from AI or less.

Strongholds and premiums to change as AI gains ground

Many companies expect competition to intensify due to the ‘winner takes all’ dynamic often associated with the massive scale that AI and digital can create. They also expect significant impact on their products, increasingly in the form of new services, and they believe the speed of developing new products and taking them to market will drastically decrease – making current competitive strongholds less viable in the long-term.

This is particularly clear in R&D intensive sectors such as Pharma, where big data-sets and intelligent algorithms to speed up the drug discovery process (10x mentioned as realistic) can impact the dynamics towards existing peers, while new AI based entrants (e.g., intelligent devices) can influence how premiums are distributed in future value chains.

Across sectors, executives expects significant impact

Services comes out on top in the ‘High Impact’ category, but all sectors expect a significant degree of impact from AI. An overwhelming share also anticipate that AI will result in entirely new products, services, and business models.

Companies from Industrial Products and CPR expect relatively least ‘high’ impact from AI, but even in these sectors, more than 30% expect the industry to be disrupted.

Limited sync of maturity and expected impact

The biggest disparity is within Finance, specifically Pension and Insurance, where ambitious companies are making significant investments in building data infrastructure and AI capabilities, while others are taking a waiting stance, and will jump on the AI train when the technology is more mature.

Services the sector with the highest expected impact from AI

How much impact do you expect AI will have on your industry within the next 5 years?

Companies in Spain are in the middle of the pack

At 40%, companies in Spain are in the middle section along with companies from Sweden, Denmark, and Ireland when it comes to expecting significant impact from AI in the future. When including companies that reported a 4 on a scale of 1 to 5, 75% of Spanish companies report that AI will have a high or significant impact on their industry. Yet, at 20%, respondents in Spain are third – after respondents in Ireland and Austria – in terms of expecting AI to have only some or little impact on their industry. According to the executives, some of the ways in which AI will disrupt industries relate to completely new business models focusing on platforms or services, intelligent decision support or radical efficiency.

— Aegon
Financial services group

Portugal has the highest share of companies expecting ‘significant impact’ from AI

High expected impact from AI consistently across countries

How much impact do you expect AI will have on your industry within the next 5 years?

Many of the participating companies are expansive, with diversified business units offering a range of products and services. We questioned where they expect AI to have an impact - in their core, adjacent and/or new business.

AI will impact across the board, but less consensus on timelines
Companies expect AI to have a relative- ly equal impact on core, adjacent and new areas of their business. In interviews, they say impact depends on the timeline, for instance AI impacting the core business now, but adjacent and new business later on. The range of answers for “Adjacent” and “New” across Europe are more split and contain more “Don’t Know” responses than for “Core” – perhaps because there is an inherent challenge in making predictions about AI’s impact on new business areas where business results are not yet realized, and where the role of current and upcoming AI technology is not clear.

Yet, interestingly 32% feel confident AI will impact areas that are “entirely new to the company.” This is not far behind the 37% of respondents who expect a very high degree of impact on the core areas of the current business.

Spanish companies expect high impact from AI
At least 50% of companies in Spain expect AI to have a high or very high impact across core, adjacent and new business areas. Specifically, at the core business is where Spanish companies expect AI to have the biggest impact, a ranking in line with the European aggregate. Some executives interviewed expect companies coming from tech-related industries to be the ones disrupting their core business.

Tetra Pak
Tetra Pak is experienced in implementing AI in various business functions. Tetra Pak generates insights from its huge volume of data and imagery collected across manufacturing lines spread throughout the world. The algorithms developed on the machine data predicts the next possible failure and is used as an input for maintenance activities. The images of finished products are fed into a deep learning-based AI system that triggers an alarm if any quality issues are detected real time.

To ensure maintenance does not lead to excessive downtime for its customers, Tetra Pak uses augmented reality for remote support. Because technicians can support customers globally, they increase their coverage and respond quickly to customers’ needs using the Hololens. Predictive maintenance combined with implementation using augmented reality benefits customers to optimize their operations through automation and planned maintenance. Tetra Pak is exploring the language based cognitive services in areas of language translation, conversational solutions(chatbots) for diverse areas.

Tetra Pak has a Data Science Center of Excellence that works on emerging AI areas and reports to the Chief Digital Officer. These experts work to utilize Tetra Pak’s vast amounts of data for efficiency, robustness, quality, and employee empowerment. To collaborate with its in-house team, Tetra Pak engages in partnerships with universities and other organizations. Through these activities, Tetra Pak is using AI to transform food processing and packaging.

What next?
Tetra Pak is looking to scale up its data science capabilities to benefit from connected solutions and connected workforce. Connected solutions enhance quality inspections, and ensures insights from one part of the world benefit other parts. Connected workforce streamlines customer engagement in sales and technical support. Tetra Pak continues to develop and test AI solutions and to demonstrate business value.

Tetra Pak leads the world in food processing and packaging. Founded in 1951 in Sweden by Dr. Ruben Rausing, Tetra Pak forms one third of the Tetra Laval Group that is headquartered in Switzerland. Dr. Rausing’s guiding premise was that “A package should save more than it costs.” AI is keeping that tenet central within Tetra Pak. Today Tetra Pak has an enormous offering of products and services that range from containers for liquid food, ice cream, cheese, and other consumables, to UHT processing and automation services.

AI enables us to leverage the unstructured data like image and generate value.

AI is empowering our colleagues with an interactive experience in areas of augmented reality, language translation services and conversational solutions.
Use It or Lose It
How is AI put to use in companies today?

AI enables a wide range of uses, broadly split into personalizing, automating, predicting, prescribing and generating insights. We asked companies how relevant each was to their business and found a significant degree of variance in terms of what executives expect to use AI technologies for.

**Prediction is the top use**
With 74% of companies seeing prediction as a relevant use of AI, this functionality, which includes churn analysis, predictive analysis, and predictive maintenance, comes out as the top use. Companies with a large customer base use churn analysis to identify and proactively engage customers with exit potential. Sales teams use predictive analysis to identify leads with the highest likelihood of conversion. Companies reliant on R&D are using AI to speed up the process of analyzing data for new product development and to inform future research.

**Intelligent automation for effectively dealing with routine tasks**
Smart automation is seen as widely applicable by 74% of companies surveyed. With estimates that 20-30% of current tasks can be done without human intervention, a substantial number of companies are currently in the process of training chatbots to transform the way information is acquired.

**Generating insights to make informed decisions**
Focusing on generating insights based on internal and external data, 55% of companies view AI as a way to make better decisions. This requires a sophisticated data infrastructure. Companies reliant on R&D are using AI to speed up the process of analyzing data for new product development and to inform future research.

**Personalization is becoming a common feature**
Among the surveyed companies, 44% are using AI to personalize the user experience, for instance by tailoring content to individual interactions as an effective way of driving mass-personalization. Next steps in personalization include chatbots and virtual assistants, where some companies already have fully automated customer front-end solutions in place.

**Prescriptions’ potential is big**
Prescription is the laggard among the five AI uses, with current use-cases typically being early stage, such as suggestion engines and decision recommendations for salespeople and advisors. AI for advanced prescription such as complex decision making lies in the future, as it requires collecting large amounts of data and understanding which variables are significant, including some that are difficult to digitize.

**Prediction most relevant in Spain**
At least 50% of respondents in Spain consider four of the five main uses of AI relevant for their company. The most common uses of AI are to predict, followed by generation of insights and personalization. Current use-cases highlighted by executives include predictive maintenance, demand forecasting to optimize supply chain operations, and predictions on customer behavior.

**Prescribe**
Suggest solutions to defined problems

**Automate**
Handle tasks without human intervention

**Insights**
Identify and understand patterns and trends

**Personalize**
Tailor content and user-experience

**Predict**
Anticipate events and outcomes

**Use It or Lose It**

Making AI Simple

What is a good framework to map the potential benefits from AI?

Companies must consider how they approach the benefit domains in their AI strategy formulation. Artificial Intelligence impacts business in four benefit domains:

1. **Enable employees**
   - E.g., increase employee efficiency through predictions, enable new value-add services, and provide real-time support.

2. **Artificial Intelligence benefit domains**
   - Transform your products & services
     - E.g., speed up product innovation cycles, enable new value-add services, and provide real-time support.

3. **Engage your customers**
   - E.g., provide customers advice, shorten conversion cycles, and reduce time to resolution.

4. **Optimize your operations**
   - E.g., improve planning and reduce costs through intelligent prediction, operational efficiency, and deep insights, predictive maintenance.

The contributing companies generally expect to benefit in all four key domains as outlined in Microsoft’s Digital Transformation framework: optimizing operations, engaging customers, transforming products and services, and enabling employees. Each domain draws on underlying AI functionalities—‘reasoning’ through learning and forming conclusions with imperfect data, ‘understanding’ through interpreting the meaning of data including text, voice, and images, and ‘interacting’ with employees, customers and other stakeholders in natural ways.

Applying AI to these domains can be transformational to a business, ultimately changing the landscape of the business itself and the industries and eco-systems in which it operates. Let’s look in more detail at what that entails.

**Improved production and efficiency through optimized operations**

While digital transformation in general is based on customer engagement, optimizing operations is what companies first look to when putting AI to use. It draws on multiple levers such as: intelligent prediction, e.g., identifying chronic diseases, anticipating non-performing products, or adaptive modeling to flag corrective actions; operational efficiency, e.g., optimizing forecasting and order-to-fulfillment flows across the value chain, or processing huge sets of documents in a fraction of the time; and deep insights, e.g., detecting anomalies to surface irregularities such as fraud, or identifying new pockets of opportunity before competitors do.

**Engaging customers more effectively through AI**

After optimized operations, companies look to customer engagement as the domain in which to seek most business benefits. Early examples of AI applications in the customer engagement space involve levers such as conversational agents, e.g., bots providing personalized recommendations and transactional advice, personal assistants, e.g., guiding decision-making, shortening conversion cycles, and self-service, e.g., options to help customers reduce time to resolution.

**Staying ahead of the competition by transforming products and services**

Transforming products and services, and enabling employees, came out on the same level, slightly below the two other domains when it comes to where companies expect to generate future business benefits.

Transforming products and services, ultimately giving rise to entirely new business models, is mostly favored in R&D-heavy sectors where companies consider AI and advanced analytics as levers to speed up the product innovation and discovery process. In B2C-oriented sectors, AI enables provision of new services via multilingual cognitive tools, geo-location suites, sentiment analysis, cognitive robotic advisory capabilities, personalized service agents and more to transcend the sectors to a new level of value-add—with significantly increased scale and reach in real time.

**Enabling employees to be more efficient and capable**

Across sectors, numerous AI use-cases focus on increasing employee productivity or serve to enhance the human ingenuity and the ability to fulfill a given function. AI helps employees in B2C companies expand organizational knowledge by analyzing vast customer behavior datasets in order to adapt online and offline store layouts, driving conversion and sales. Customer personalization is used at scale, powered by AI solutions that reveal real-time customer insights, identifying the best next actions for up-sell and cross-sell opportunities, as well as predictive models that obtain a 360-degree view of the customer by integrating customer data and sentiment to generate targeted offers.

*We’re still in a preliminary approach to AI, but it’s an unstoppable motion.*

— Globalia

Tourism company
Where Value Hides
What benefits do business leaders particularly expect from AI?

Respondents were asked to assess the potential of AI within each of the four benefit domains.

Optimizing operations and engaging customers to deliver most value
Among all companies surveyed, 89% expect AI to prove beneficial in optimizing operations, with use cases most highlighted by executives being monitoring results, predicting trends, and prescribing future solutions. A lot of focus is given to intelligent automation, such as making compliance cheaper and more robust, improving risk analysis, optimizing supply chains, providing predictive maintenance capabilities, and more.

Not surprisingly, the ability to structure repeatable processes and reduce human error and bottlenecks is something most executives can get behind from a cost-saving perspective. 74% of companies surveyed expect AI to help them engage customers and enhance the user experience, including tailoring content, increasing response speed, adding sentiment, creating experiences, and anticipating needs.

Companies in Spain expect AI to optimize operations and engage customers.
Among Spanish companies surveyed, 95% expect AI to optimize their operations in ways such as automating tasks and forecasting capacity, above the European aggregate (89%); 85% believe AI will benefit customer engagement, for instance by identifying customer needs and tailoring offerings; and 50% expect AI to enable employees by helping them take informed decisions, or explore new capabilities. Lastly, 40% of Spanish companies expect AI to transform their products and services compared to 67% for the European aggregate.

Fewer expect products and services and employee engagement.
Although executives speak of the potential in making sense of existing and new sources of data to introduce higher margin services to product portfolios, expedite new product development, and introduce innovative new offerings, only 65% expect AI to help transform products and services.

Even fewer (60%) expect AI to provide benefit from empowering employees to improve productivity, enable innovation, support problem solving, etc.

What we did hear overwhelmingly, however, was the importance of bringing all employees along on the company’s AI journey. This involves getting internal buy-in that AI will be a force for good, generating excitement about working with intelligent technologies, and making existing jobs easier and more engaging.

Most companies expect to generate benefit from optimizing operations
What business benefit do you expect AI to generate?

89% Optimizing operations
74% Engaging customers
65% Transforming products & services
66% Empowering employees

Companies in Spain expect AI to optimize operations and engage customers.
Among Spanish companies surveyed, 95% expect AI to optimize their operations in ways such as automating tasks and forecasting capacity, above the European aggregate (89%); 85% believe AI will benefit customer engagement, for instance by identifying customer needs and tailoring offerings; and 50% expect AI to enable employees by helping them take informed decisions, or explore new capabilities. Lastly, 40% of Spanish companies expect AI to transform their products and services compared to 67% for the European aggregate.

For TomTom, the constant need to revise their comprehensive digital maps that are delivered to their customers on a weekly basis means that the question is how quickly, not whether, they can integrate AI into their operations. TomTom now make up to 1.5 billion updates to their digital maps a month in their efforts to support their customers in a world that increasingly relies on digital maps as accurate representations of reality. The challenge of updating their digital maps is concerned with volume, quality and lead time – in other words needing to make lots of accurate changes as quickly as possible. With 570 updates made every second, this would not be possible without AI-based automation. Eventually, such manual tasks can be carried out by AI to free human resources up to do more value adding work.

What next?
AI is set to play a crucial role in the near future as an enabler of accurate and scalable data processing, with an ultimate aim of real-time updates to TomTom maps. This will help TomTom offer its users a safer and more comfortable driving experience. Further, with a growing number of sensors and devices on vehicles everywhere, the exponentially growing volume of traffic data, paired with increasingly powerful processing solutions, can bring TomTom’s technology a step closer to enabling safe autonomous driving vehicles.
Executives surveyed and interviewed in the various sectors recognize the distinct benefits of AI, speaking about the myriad of ways they see AI transforming their businesses and industries. Although there are clear patterns to discern, executives from different sectors often speak to different benefit areas from which they particularly hope to capitalize from.

**Services companies expect the most benefits from AI**
Services companies reported the highest expected benefits across all four domains, expecting significant value from AI through engaging customers and empowering employees, for example via improving resource and skills allocation across their large human capital pools. (Note: the Services sample is the smallest of all sectors.)

**Expedited drug discovery and disease prediction in Life Science**
Executives in Life Science are among those most excited about benefits pertaining to transforming products and services. Many see AI leveraging existing internal and external datasets to speed up the drug discovery process and enable the transition towards precision medicine. Deep learning with huge datasets is the key focus of this sector.

**Finance companies reported some of the highest expectations for AI benefits across the four domains, which can explain the sector’s current front-runner status.** Finance companies reported some of the highest expectations for AI benefits across the four domains, which can explain the sector’s current front-runner status. From using machine learning to detect fraud and automation to streamlining KYC efforts in the back office, and to reducing compliance and regulatory costs via technologies that digest vast quantities of legal documents, banks and other financial institutions are looking to provide higher quality services at faster speeds and lower costs. Similarly, mortgage applications can be approved in a matter of minutes, and vice versa at faster speeds and lower costs. TMT expects AI to increase engagement, insights, and connectivity.

**AI to revolutionize Financial Services firms**
Finance companies reported some of the highest expectations for AI benefits across the four domains, which can explain the sector’s current front-runner status. From using machine learning to detect fraud and automation to streamlining KYC efforts in the back office, and to reducing compliance and regulatory costs via technologies that digest vast quantities of legal documents, banks and other financial institutions are looking to provide higher quality services at faster speeds and lower costs. Similarly, mortgage applications can be approved in a matter of minutes, and vice versa at faster speeds and lower costs. TMT expects AI to increase engagement, insights, and connectivity.

**As a railway company, we have significant physical assets that need to be maintained. With AI we see significant opportunities, like automatically detecting faults in railway tracks and predicting maintenance needs. This improves not only efficiency but also security.**

— SBB Swiss Federal Railways
Railway company
In order to use a tool, first you have to know about it. It’s important to approach this change not only at the technological level, but also in terms of sales, marketing and support. The more we know about it, the more uses and needs will unfold along the way.

— Globalia  Tourism company

That you begin with the right approach to leveraging AI, such as ensuring your data isn’t inherently biased and building explainability/auditability into your algorithms. There is also some risk with making assumptions as to how AI will impact the business without collecting the data. It is easy to get excited with the opportunities afforded by AI, but it is important to take a data-driven approach.

— Randstad  HR services firm

There are inevitable concerns about the business risks associated with AI, as many of the applications of the relatively new technology are still in their early development while receiving significant media and political attention. However, from what business leaders tell us, they are balancing their excitement about AI’s potential with some healthy reflections on key business risks, not at the risk of investing in a technology that may not prove its commercial value if not done correctly.

Broad concern with regulatory landscape
Over half of all companies surveyed expressed concern regarding regulatory requirements. This concern can broadly be split into compliance with existing requirements and navigating the nascent, often ill-defined regulatory landscape for AI. For the former, companies need to take advantage of solutions in accordance with everything from GDPR to cybersecurity concerns. For the latter, the lack of clarity around AI regulation can slow down scaled implementation as business leaders worry about investing in solutions when the rulebook is still being written. Many first movers within our AI report feel they need to write the rules themselves and hope for the best.

Concern with the human in the new machine age
A prevailing risk many companies were also concerned with was impact on personnel. The need for employees across the organization to buy in and adapt to working with AI touches on all industries and markets. The instinctual fear of job losses among personnel is one that needs to be managed as AI will often transform the daily tasks of employees, rather than replace them altogether, allowing for more people-oriented or creative work. There is also a larger task in training employees to work together with AI, usually a challenge and risk in itself.

Seeing the wood for trees
A further dominant risk articulated by several surveyed business leaders is about feeling information overload. AI can help make sense of huge quantities of data, but setting up AI and learning to use it effectively requires feeding the technology the right data and working out what is useful versus what is noise. A further element in the risk of overload is understanding the different AI technologies and solutions available and making sense of technological as well as market developments to know where to make strategic use of AI.

Top 3 business risks in Spain

1. Regulatory Requirements  35%

More than a third of companies in Spain expressed concern about regulatory requirements, and in particular, the need for clear guidelines and regulations regarding AI. Without such clarity, investment in AI can be perceived as risky for companies because they may invest in something allowed at the time that may not be later on. Spain shares this concern with other European countries surveyed, for almost all of them, this risk was in the top three.

2. Information Overload  25%

Information overload may occur when trying to figure out what is useful in vast amounts of data, identifying insights or establishing predictive trends. Working with such large amounts of data requires consideration for the users looking for understandable, actionable results. As companies implement AI, they are considering both the technical aspects of working with very large datasets and the human aspects of interpreting the results in a real-world, business context.

3. Impact on Personnel  20%

AI is not just about technology. The adoption of AI is equally about change management, including culture and mindset shifts. It requires balancing employees’ fear of losing their jobs with the awareness that once AI frees them from menial tasks, they will gain more time to help customers and develop products and services. It is also about recruiting new employees and supporting current employees as they adopt new kinds of technology.

Note: Affirmative responses, Spain. The respondents were asked to select all that applied of the following response options included: Diffusion of resources, Loss of control, Uptake of the system, Information overload, Regulatory requirements, Impact on personnel.
Learn from the Leaders

The promise of AI lies in creating business value.

We have identified the eight most recognized capabilities needed to successfully create value from AI, and assessed how competent companies are within each.

Perhaps more importantly, the executives we spoke with highlighted the importance of these 8 competencies as those needed to successfully create value from AI.

This section explores the necessary eight capabilities to develop AI maturity, realize tangible business benefits, and minimize risk. As exhibited in the chart on the following page, we asked the companies to rank the importance of these capabilities in terms of incorporating AI into their business, as well as to self-assess how competent their companies are with regards to each AI enabling capability.

**The human element and technology**

Some of the eight capabilities center around human elements: AI Leadership; Open Culture; Agile Development; Emotional Intelligence. Others are more technology-oriented: Advanced Analytics; Data Management; Emerging Tech; External Alliances.

**Ranking of key capabilities for realizing AI potential**

Advanced Analytics comes out on top as the most important AI enabling capability among the companies surveyed. Data Management is second. AI Leadership is perceived as the third most important capability. Open Culture refers to collaboration and the ability to embrace change and uncertainty.

Understanding how to deploy the right Emerging Technologies in a future proven way is ranked fifth, followed by Agile Development, where self-organized teams are characterized by shorter project cycles, the ability to work with constantly evolving technology, and transparency regarding success and failure that leads to wider buy-in and scaling.

Entering into External Partnerships ranks second to last in terms of importance, perhaps because it’s the area that resonates most with existing capabilities and where business leaders perceive themselves most in control.

As the majority of companies we spoke to are looking to supplement their in-house skills with external partners when building their AI solutions, particularly for pilot projects, it is not due to a general lack of relevance.

Bringing behavioral science into play via Emotional Intelligence to build solutions that understand and mimic human behavior, and make it easier for humans to interact with the technology, is seen as the relatively least important AI-enabling capability. An explanation for this could be that the technical skills are still so relatively complex for companies to grasp and establish, that more advanced human cognitive skills become less of a priority at this stage.

Noticeable sector deviation

As exhibited in the following chart, where business leaders are asked how competent their company is in relation to the most important AI-enabling capabilities, the sector aggregate scores land at or just above the median, with a fairly close spread. Sectors that are more mature in using AI are those that report higher competency in Advanced Analytics – particularly TMT (Telecom, Media/Entertainment & Technology), as well as Finance (including Banking, Investment & Insurance), and Life Sciences (including Healthcare & Pharma) all report lower competency in AI Leadership. A possibility is that in the pharmaceutical industry, AI chiefly resides in R&D, and has yet to affect the broader organization on the wider strategic level.

Companies intend to use various levers to obtain these AI capabilities. Companies are relatively evenly split between using recruitment (60%), training (56%), partnering (57%). Only 10% of the companies use acquisition of teams or businesses as a way to fast-track building much needed AI capabilities.

8 capabilities

1. **Advanced Analytics**
Obtaining and deploying specialized data science skills to work with AI by attracting talent and working with external parties

2. **Data Management**
Capturing, storing, structuring, labeling, accessing and understanding data to build the foundation and infrastructure to work with AI technologies

3. **AI Leadership**
The ability to lead a transformation that leverages AI technology to set defined goals, capture business value and achieve broadly based internal and external buy-in by the organization

4. **Open Culture**
Creating an open culture in which people embrace change, work to break down silos, and collaborate across the organization and with external parties

5. **Emerging Tech**
The organizational-wide capability to continuously discover, explore and materialize value from new solutions, applications, and data platforms

6. **Agile Development**
An experimental approach in which collaborative, cross-functional teams work in short project cycles and iterative processes to effectively advance AI solutions

7. **External Alliances**
Entering into partnerships and alliances with third-party solution providers, technical specialists, and business advisors to access technical capabilities, best practices and talent

8. **Emotional Intelligence**
Applying behavioral science capabilities to understand and mimic human behavior, address human needs, and enable ways to interact with technology and develop more human-like applications

**Capabilities. How?**

What competencies are required to get AI right?
AI Competency Model

Advanced Analytics and Data management considered most important AI capability
How competent is your company within these organizational capabilities?
How important is each of the organizational capabilities for your success with AI?

TMT leads the other European sectors in AI competency
How competent is your company within these organizational capabilities?

Note: Don’t know answers not included in average score.
Average competency and importance for Spain and 15 European markets (1: lowest – 5: highest).
Capabilities ranked according to highest importance in 15 European markets.
1. Advanced Analytics

Obtaining and deploying specialized data science, data engineering, data architecture and data visualization skills by training employees, attracting talent and co-creating with external partners

The backbone of AI is made up of skilled, intelligent minds who are capable of understanding business problems at the granular level, and deploying AI to effectively solve or support others in solving these problems. This requires technical data science and mathematical engineering skills, to hybrid profiles with sufficient business acumen to decode problems and ability to tackle them using quantitative methods.

A self-fulfilling talent prophecy

It is evident from the study that there is a major lack of technical data skills to meet the drastically rising demand for AI. As a result, the hunt for AI experts has become extremely competitive, and it is far from uncommon that functional AI experts are paid higher salaries than their superiors are - in some cases leading to new HR policies to reflect evolving requirements.

Several business leaders state that the lack of AI talent is the greatest barrier to implementation within business operations. Interestingly, companies that have chosen an early adopter strategy for AI have been successful in attracting senior professionals who again have been able to build out sizeable AI teams in their companies – based on the premise that talents seek talent – making AI recruitment a self-fulfilling prophecy for these pioneering companies.

In other words, the longer you wait, the harder it can be to get the right people. Consequently, a ‘wait-and-see’ strategy can be risky for companies that are AI followers due to the scarcity of talent, which may prove impossible to attract once the company is ready to make a more ambitious move into AI.

While many companies struggle with acquiring AI talent, we also experienced companies - even in traditional industries such as Transportation and Industrial Products - with AI teams of +35 experienced data scientists holding Ph.D’s in mathematics, astrophysics, etc., from high profile universities. Most often, these companies have been first movers on AI and attracted senior practitioners tasked with building out sizeable AI communities to work on the most strategic business agendas.

Hybrid profiles becoming the hardest currency

One of the most consistent inputs from the executives was the need for people with deep domain knowledge combined with strong technology proficiency. This hybrid profile is essential to identify relevant use-cases in the business with possible AI solutions.

Contrary to data scientists, software engineers, and even data architects that can be recruited externally, the hybrid profile is often nurtured by training existing employees from the line of business and adding AI skills. To succeed however, a fundamental appreciation for technology is required.

What to learn from AI leaders:

1. Providing interesting problems, good data, and a freedom to thrive in a non-corporate environment is key to attracting talent.
2. A wait-and-see follower strategy can prove risky and put companies in a talent scarcity trap.
3. Training existing staff with deep business instincts is key to make AI work - and effective when access to talent is challenged.

Telecom is advanced and challenging technologically so we need to combine the best minds in deep domain competence with the best minds with deep knowledge in machine learning and AI. So we are working with talent on multiple layers.

— Ericsson
Telecommunications company

companies talk about their efforts to increase their competency in this area, and in particular, mention challenges around finding the needed skills and personnel, and appropriate applications of advanced analytics.

Co-creating to compensate for blind spots - while avoiding the black box

The scarcity of available talent has led companies to increasingly co-create solutions with external partners who bring with them specialized know-how. However, executives very clearly point to the need for internal AI capabilities in the receiving end to understand the real problems and evaluate the performance of external partners.

Companies find that AI solutions implemented by external partners become black boxes unless the organization is capable of contributing and taking over the solutions after delivery. Avoiding black boxes is a general concern among executives. Consequently, internal data scientists must be able to decode and dissect AI applications to explain the underlying rationales. Such rationales are important in making AI-driven solutions creditable, and greatly reduce the risk that an AI application draws wrong conclusions based on false assumptions.
Companies tend to focus their AI efforts in areas where they already have relevant data. We found that the amount of available data varies significantly by sector but regardlessly, a significant proportion of the time companies dedicate to AI is spent on data management related tasks.

Data governance is no trivial task
One of the major hurdles companies face regarding data is governance, particularly who ‘owns’ it, how data is stored, how to access it, and who may access it are all essential questions when working with AI. Questions that used to be about efficiency suddenly become highly strategical and complex to respond to without rethinking governance structure and policy. Governance aside, the most common obstacles to using data are organizational silos or legacy systems built for specific purposes, resulting in decentralized storage that limits access.

The ethical use of data is a challenge or risk.
Data must be stored properly. The person who generates the data is also the owner of the data, and that person has to decide what to do with it.

— Royal Philips
Health technology company

Companies reported that they typically spend 2-3 years building the appropriate data infrastructure for AI, and many respondents with the most ambitious AI visions are still spending the majority of their time fine-tuning their infrastructure.

Data privacy regulations
Data infrastructure is not only a prerequisite for effectively working with AI, but is increasingly needed to comply with data privacy regulations, which respondents see as a key risk. The recent implementation of GDPR in the EU has highlighted the need to govern what data is being used for. AI-specific regulation is in many ways still immature, and AI leaders find that a lack of clear guidelines can limit their progress.

Advanced companies (also) appreciate external and unstructured data
To build precise and useful AI solutions, companies need not only a lot of data, but also accurate data that is appropriately structured and labeled. Data is often reported to be in a state that it is simply unusable, as it could lead to undesirable or unreliable outcomes.

While most companies are preoccupied with cleaning, structuring and migrating historical data, some have chosen to build new data structures from scratch to collect the correct data going forward. Interestingly, we found that while companies that are less mature in AI tend to use mostly structured data from internal data sources, a significant 80% of the most advanced companies also use both structured and unstructured data, and an equivalent 80% use data from both internal and external sources.

Similarly, 60% of these self-rated most advanced companies report use of hybrid architectures of on-premise and cloud based storage, while the less advanced predominantly rely on on-premise platforms.

Data Management is one of the most important capabilities in Spain
Spanish companies rate Data Management at the top of the most important of the eight capabilities necessary to succeed with AI (4.2 on a scale of 1 to 5). However, the average level of competence (3.4) in Data Management is lower than this average level of importance. Out of the Spanish companies surveyed, 85% report to be moderately competent or above in Data Management among with only 5% considering themselves highly competent in this capability. This suggests that some companies have developed a Data Management foundation but are still midway before achieving the capability level that will fully back their AI systems. Introducing an adequate data governance structure and finding the right quantity and quality of data is essential according to many of the companies interviewed.

The ethical use of data is a challenge or risk.
Data must be stored properly. The person who generates the data is also the owner of the data, and that person has to decide what to do with it.

— Royal Philips
Health technology company

We can provide a more personalized service to our guests, both before check-in, during the stay and after check-out. Content personalization and recommendations will further improve customer engagement.

— Grupo Pestana
Hotel chain

2. Data Management
Capturing, storing, structuring, labeling, accessing and governing data to build the foundation and infrastructure to work with AI technologies
3. AI Leadership

The ability to lead an AI transformation from top to bottom - by articulating a vision, setting goals and securing broad buy-in across the organization

As with any corporate transformation, the foundation for successful deployment of AI is executive leadership buy-in and sponsorship. The C-suite must be aligned in what they want to achieve, and AI must be placed on the strategic agenda to ensure that AI efforts are an integral part of the company’s overall strategic goals, that capital is allocated, and employee time is dedicated.

**AI Leadership among the lowest competency of all capabilities**

Given the relative importance of AI Leadership (avg. 4.2 across all sectors), it is interesting to see that business leaders self-assess their level of competency as among the lowest of all eight AI enabling capabilities, with an avg. competency of only 2.9; 66% of respondents state that their companies have moderate, little or no AI Leadership competency. Many executives are realizing that business acumen is not enough in itself for understanding how AI is impacting the business. As AI technologies become increasingly complex, leaders must be able to launch, support and, where necessary, challenge relevant AI initiatives against strategic business imperatives. The disruptive potential that companies believe AI will have also means that leaders should anticipate and prepare for a broader change management exercise aimed at embracing the change from AI on multiple levels.

**Significant variation in AI conversations from top to bottom**

Interestingly, data revealed that AI is considered an “important topic” on the C-suite level among 73% of the companies surveyed. However, less so on the Board of Director level where it is only considered an important topic in 38% of companies, and even less so on the operational employee level with 28%.

We observed in the interviews that companies very rarely have AI capable leaders across the Board of Directors, Executive Management, and Functional Management layers. Senior AI leaders can sometimes be found on one of the levels, but rarely with any speaking leadership colleagues to challenge ideas. This leadership vacuum was often pointed to as an issue from lower level AI experts.

**Going from talking and building to doing means that you take it to the decision point where leadership has to decide A or B, based on an AI-generated result. From an intellectual perspective, it is easy to say that you will follow AI results. But when the moment comes where you choose between recommendations based on old methods and AI, if you choose AI, that is when change truly happens.**

— EQT
Private equity group

---

**What to learn from AI leaders:**

1. The organizational transformation driven by AI will be continuous - this requires seeing AI as a process, not a project.
2. Leadership must be accustomed to AI technologies to understand how it will affect the company.
3. Articulating a clear AI vision is key to achieving buy-in and motivating exploration of use-cases with uncertain outcomes.
4. Open Culture

Creating an open culture in which people embrace change from AI, navigate confidently in uncertainty and ambiguity, work to break down silos, and collaborate seamlessly across the organization.

New technologies have often disrupted how work is conducted. AI is no different. Establishing an open, collaborative culture to minimize resistance and enable human performance can prove efficient to prepare the organization for transition. However, this may be difficult, as the magnitude of impact driven by AI can imply a fear of uncertainty, ambiguity, and a general resistance to change.

Risk to employees less of a concern among most advanced companies

Companies reported that employees generally have a positive attitude towards AI. Yet, one thing is having a positive attitude in general, another is to retain an open attitude once new technologies start impacting the way work is done.

To achieve buy-in, business leaders must make the changes due to AI tangible to reduce organizational uncertainty. However, companies expect a significant impact from AI which will drive a fundamental transformation and increasingly ask in tasks previously performed by humans.

Interestingly, the companies that self-rated as most advanced see a lower risk to personnel than the less advanced (only 20% of advanced reported this risk as a concern vs. 43% for the companies still in the “planning” phase).

Relatively small competency gap

With a relatively small gap between importance (avg. 3.9) and competency (avg. 3.2), creating an Open Culture is one of the capabilities where business leaders feel most comfortable.

An obstacle mentioned by many respondents is the ability to work collaboratively across the organization despite AI most often being put to use towards quite narrow use-cases. With benefit areas being limited to specific domains or functions, it is often not seen as relevant to involve the organization in a broad and collaborative approach on AI.

 Cooperation across the organization

Many of the most advanced companies that have been able to produce several AI projects have also managed to establish links and cooperation across the organization. These cases indicate that the benefits of an open work culture far exceed the difficulties and associated risks.

An obvious obstacle to an open culture is the fear of job losses with the introduction of AI. According to respondents, the fear of workforce redundancy has some merit, but the concern should not overshadow the significant benefit potential of AI. A pivotal task for company leaders is to proactively articulate a tangible vision for AI initiatives. This will make it easier for employees to understand the AI opportunities on a personal level, and thereby embrace the change ahead.

You cannot only have data scientists do it. They have a super important role but you also have to complement them with designers. Because you need to find the use cases where you apply those types of technologies. When you do projects without a design approach they often become irrelevant basically. Even though it is the fantastic technology that can bring fantastic results, it has to be embedded in a design approach to meet the customer needs and solve real problems.

— IKEA Group
Furniture retail company

Most companies rate themselves moderately competent in Open Culture

How competent is your company within creating an Open Culture?

Spain is moderately competent in Open Culture

Spanish companies consider themselves to be slightly above moderately competent in Open Culture (3.2) – same as the European average. This capability is considered somewhat above moderately important (3.6), indicating that Spanish companies on average do not believe this is one of the key capabilities necessary for their success with AI. Yet, some companies highlight their efforts to establish the type of culture and leadership that embraces AI and is willing to take on the challenges that come with it.

What to learn from AI leaders:

1. Establish cross-organizational projects to foster collaboration and learning across functions.
2. Ensure employee buy-in by being open and clear about on-going projects and desired outcomes.
3. Ensure that governance structures support collaboration through projects co-owned by AI experts and business leaders.

Learn from the Leaders

We have multiple sources of ideas for AI. They can come from the business but also from data science teams presenting different possibilities in a proactive approach, as these are new skills within the company. At the end, there has to be agreement between both groups to sign off on AI projects.

— Tetra Pak
Food processing and packaging company

Learn from the Leaders
5. Emerging Technology

The organization-wide ability to continuously discover, deploy, and create value from intelligent solutions, applications, and data platforms.

Evidence of the rapid pace of technological change are plentiful in today’s digital world. What we have seen is that there is a definite correlation between companies that are ahead of the pack with AI and with the wider technological adoption. That AI benefits from being able to identify and implement emerging technology may seem intuitive and obvious, yet finding the right formula is no trivial exercise.

**How strong is your tech radar?**

With an average score of 3.3, the ability to explore and implement emerging technology is an area where business leaders perceive their companies to be most competent across the eight AI enabling capability areas.

One factor in working with emerging technology is being able to quickly integrate innovative trends and cutting-edge technology due to the burden of legacy systems, slowed business units, and complex governance processes.

**Do you enable or hinder innovation?**

Once companies are able to selectively source new solutions from the outside world, the challenge is then how to enable it. This can be a case of actively encouraging enablement, or at the very least not hindering it. Many companies treat AI as a crucial piece of a wider digital puzzle, where dots need to be connected across technologies. This means success with established technologies, from cloud and SaaS platforms to getting the basics right with analytics, is key to building on what is already there.

Working with emerging technology also relates to agile development and the ability to trial, test and experiment in iterative, short cycles. This kind of working culture allows companies to work with less stable, untested technology. Enabling innovation requires an outlook from the very top and the ability to trial, test and experiment in iterative, short cycles. This kind of working culture allows companies to work with less stable, untested technology. Enabling innovation requires an outlook from the very top and the ability to trial, test and experiment in iterative, short cycles. Enabling innovation requires an outlook from the very top and the ability to trial, test and experiment in iterative, short cycles. This kind of working culture allows companies to work with less stable, untested technology. Enabling innovation requires an outlook from the very top and the ability to trial, test and experiment in iterative, short cycles. This kind of working culture allows companies to work with less stable, untested technology. Enabling innovation requires an outlook from the very top and the ability to try and navigate a tech sea characterized by uncertainty, a recurring theme when interviewing executives is the importance of balancing excitement with new technology and commitment to an innovative mindset, with one foot planted firmly on the ground.

Seeing past the hype, remembering the business model, and not wasting finite resources on every shiny object is also important. In other words, remembering as a leader that while experimenting is crucial, not all that glitters is gold.

**What to learn from AI leaders:**

1. Build a radar to pick up on emerging tech trends and connect them to market opportunities.
2. Look past the technology hype and remember the business model - it may likely need to change in the not so distant future.
3. Cloud solutions can be helpful to engage with multiple datasets across sources - increasingly a priority to capture value from new pockets.

The challenge is to understand how to benefit from something that is so new and some AI technologies are not mature so it is not that you can do a ‘plug and play’ approach. There is a lot of work and adoption to do as there are no solutions that you can just buy and start using.

6. Agile Development

An experimental approach in which collaborative, cross-functional teams work in short, iterative project cycles to effectively progress AI solutions

Considering that many AI technologies are still in their infancy, working with them is far from plug and play. To overcome this, many of the companies that are successfully working with AI tend to take an agile, iterative approach to projects. Using this approach, these companies greatly increase their ability to explore AI potential due to a drastically reduced project cycle time and dynamic risk reduction. Short project cycles result in project teams receiving constant feedback on what works and what does not, to continuously steer the direction of the project. This creates a process centered on learning and experimentation, helping to build internal knowledge and capabilities.

Most advanced companies deploy top down or via a hybrid model

With an average competence level of 3.2, Agile Development is an area where companies are self-reported to be reasonably skilled. Quickly establishing proof of concept is key to organizational buy-in, and many companies report that an agile, iterative approach helps them build evidence and proof in a fraction of the time it takes for a more traditional project.

This has great significance, as they find that tangible proof of concept instrumental in achieving buy-in and understanding in the wider organization. Efforts to develop proof via agile development processes are often orchestrated by a central unit that collaborates with business units to identify use-cases. Of the most advanced companies, 80% deploy AI into the organization via top down only or a via hybrid of top down and bottom up.

It varies whether these central units take a leading role in pushing the agenda, or instead focus on gathering knowledge and experience from already existing efforts that are decentralized in the organization.

Agility provides the opportunity for informed changes of direction

Taking an iterative approach can also help mitigate risks. Frequent feedback loops allow the project team to better identify, understand, and correct undesired outcomes before the AI application is put into production, potentially doing harm. This flexibility does not only apply to risks, as agile projects can generally use continuing knowledge and experience to make informed changes of direction and avoid the “black box” syndrome.

Contrary to agile projects, ‘big bang’ projects are more destined to fail as they skip the learning process, and lack the important feedback loop pivotal to developing good AI solutions. The world of AI is simply too complex for humans to foresee potential issues, and therefore an agile approach is better.

—— Egmont
Media company

What to learn from AI leaders:

1. Agile development is effective in engaging people across functions, fostering collaboration, and bridging tech and business.
2. Iterative processes promote quick internal learning due to their frequent feedback loops.
3. Fast experimentation with pilot projects and use-case testing can quickly show how to create value through AI.

We have learned a lot from the pilot projects we have had. You need to take an explorative approach to this and accept that governance and project management is very different for these types of projects.

—— William Demant
Healthcare company

Spain is moderately competent in Agile Development

Spanish companies consider themselves on average moderately competent within Agile Development (3.1), one of the lowest competence ratings in Spain. In terms of importance, Agile Development is also among the lowest in Spain, and below the European average (3.6 vs. 3.8). Many companies talked about AI pilot projects being introduced in at least in some areas of their organization. However, focusing on agile development is new to many companies as they are in the initial phases of devising these types of approaches.

Agile development new to many business departments

Most companies fully understand the need for agile development, but less reckon that they have the necessary capabilities for it. Working in an agile manner is very different from what most organizations are used to. While the department running an AI project might be accustomed to following an agile approach, the vast majority of project teams consist of people from other parts of the business.

Several IT and AI departments indicate that this collaboration can be difficult, but still see it as pivotal to drive value from the projects. Getting the business accustomed to working in an agile manner is not easy, as it requires acceptance of new ways of governing and evaluating projects.

The outcome of agile projects is typically less predictable than for traditional projects, and for stakeholders to fully embrace an agile approach, they have to accept this randomness and recognize the value of learning.

—— William Demant
Healthcare company

7. External Alliances

Entering into partnerships and alliances with academia, solution providers, and AI specialists to access technical capabilities, best practices and talent

AI leaders are increasingly opening up to create collaborative alliances with external partners, enabling them to tap into a significantly larger pool of capabilities and talent, and to reduce the time it takes to develop or deploy working solutions.

This trend seems to be the new modus operandi, unfolding across markets and sectors. It is also the capability with the smallest gap between perceived importance and competence level among the participating companies.

Technology, data, and service delivery partnerships

Development of AI and delivery of related projects are most often done with a mix of internal and external stakeholders. The rationale is multifaceted – some companies are simply struggling to obtain the needed talent, whereas others see a partnership approach to be a faster, more flexible solution. These external alliances typically come in two forms: being focused on technology and technical AI know-how, or focused on strategy and business development.

Academia playing a more noticeable role in collaborating with companies

It is becoming increasingly common for companies to enter into partnerships with universities in order to position themselves within AI and get access to crucial knowledge.

Companies also see this as a way of establishing a pipeline of AI talent already familiar with their business and the problems they face. Some of the more ambitious companies have a strategy of positioning themselves within AI, comprised of active conference participation and multiple university partnerships in which they actively participate in developing courses and programs.

Documentation of code is proving a challenge - also to external

The lack of code documentation for self-learning algorithms was often mentioned as a very practical issue with AI in general. This led some companies to prefer internal teams and individuals in order to ensure that despite poor documentation, the knowledge about the code at least stays inhouse.

External Alliances the highest competency in Spain

In Spain, 90% of companies surveyed consider themselves to be moderately or highly competent in External Alliances (3.5). This capability is the highest ranking in terms of competency. However, in terms of importance, it is the second to last for Spanish companies (3.4). In Spain, the importance and competency in External Alliances is virtually at the same level. This suggest that many companies have engaged in partnerships and gained some experience from it. Yet, they are still on the early phases of deploying AI and may consider it more important to focus first on developing internal AI capabilities.

What to learn from AI leaders:

1. Make sure to have internal people in the receiving end before widely engaging with external partners.
2. Academic partnerships are an increasingly sought after way to access innovative eco-systems, gain new insights, and explore emerging AI opportunities.
3. Partnerships can pose a challenge to many business processes; consider involving key functions like legal early, to ensure a productive partnership structure and effective collaboration model.

Our way of building our AI capabilities in the company is through innovation. We are innovation driven by the use of start-ups program and trying to develop win-win strategies through partnerships with companies that are not our main competitors.

8. Emotional Intelligence

Applying behavioral science to understand and mimic human behavior, address needs, improve human-machine interactions, and ultimately create more human near applications

AI has for long focused on cognitive capabilities and skills within mathematics, statistics and logical reasoning. Adding human emotion and intelligence, these capabilities move to a new, more complex level: the understanding of human behavior, and the ability to interact accordingly with technology.

Changing the way people interact with technology
One of the limits of traditional AI has been the inability to understand human traits such as emotional state, for instance exhibited in writing, physical condition, or tone of voice. With AI’s cognitive intelligence capacities within reach, machines are increasingly able to sense, recognize, and decode human traits.

This holds the potential to fundamentally change the way people interact with machines, making technology capable of handling more complex tasks and ultimately augmenting humans to an extent previously unachievable.

Emotional Intelligence in its infancy
Except for advanced companies, survey results indicate that companies view the adoption of emotional intelligence in AI processes as the least important capability, and the one where they have the lowest competency. When asked to address why this is, companies across sectors and markets note that they are still at a relatively low maturity stage where more immediate requirements such as Advanced Analytics, Data Management and AI Leadership are more relevant and prevalent.

However, when taking a deeper look at the companies that have assessed themselves to be ‘Advanced’ in terms of general AI maturity - meaning that AI is actively contributing to many processes and enabling quite advanced tasks in the company - it is interesting to see that they perceive the Emotional Intelligence capability as more important with a score that is noticeable higher than the average score for all companies.

Many advanced companies perceive this to be either ‘very’ or ‘highly’ important. Notably, these companies come from five different markets and a wide variety of industries, including Life Sciences, Financial Services, TMT, CPR, and Services & Hospitality.

Value in customer-facing applications
The need for behavioral science to understand human needs is expected to increase with the integration of AI in smart devices, and in customer-facing applications such as chat bots, robocall-visories, customer inquiries processing, etc. The most advanced companies’ AI technologies are beginning to decode human emotions from text, such as irony, anger, and frustration. This will obviously become more valuable as it is increasingly applied in customer-facing solutions with the ability to learn and improve.

Human centrism requires strong leadership
While emotional intelligence holds great potential that could lead to early adopters gaining a competitive advantage, long-term success is dependent on not only technological development, but also leadership.

Leaders must drive the transformation that will make humans comfortable with intelligent technology, as a prerequisite for harvesting its potential benefits. What the most advanced companies have shown is that this transformation must augment human ingenuity to become truly effective.

Companies consider themselves least capable within Emotional Intelligence
How competent is your company within applying Emotional Intelligence?

Not competent
Limited experience with adapting behavioral science into the AI development process, at best outsourced

Moderately competent
Appreciation of behavioral science and cultivation of uniquely human skills to increase value from AI

Highly competent
Human-centered approach, ethical mindset and values that engender trust and human ingenuity beyond business effects

What to learn from AI leaders:
1. The most advanced companies are putting emotional intelligence to use within their AI applications, despite its relatively infant stage.
2. Companies must develop their behavioral science capabilities to mimic human behavior and translate it to technology.
3. Many have virtual assistants, chat bots, and natural language processing, a powerful way to get started with building emotional intelligence into AI solutions.
Novartis

The challenge is that AI will be available in many different places so you will need to manage all AI and machine learning in all your products and services. It is not in one place or one function, it is all over the place.

— Ericsson Telecommunications company

It’s about having the right mindset. It’s not that tomorrow everything will be different. It’s all about building up capabilities and speeding up constantly. The power of technology in general is overestimated in the short term and underestimated for the long-term and I think that’s the case with AI too.

— VodafoneZiggo Telecommunications company

Novartis sees AI as a business necessity, and has CEO-sponsored AI initiatives in several business functions, including drug discovery and clinical trials. In drug discovery, AI systems use predictive hypotheses to systematically and repeatedly search through possibilities, looking for compounds that interact desirably with biological processes and mechanisms, at a pace much faster than humans can accomplish.

Al enhances Novartis’ patient-centric clinical trials by identifying patients most appropriate for a particular study, including through genetic analysis. By broadening the patient search while simultaneously looking for precise characteristics, AI identifies more patients who would benefit from a particular drug therapy. This also increases the accuracy of the trials by controlling variables that might confound a study.

By broadening the patient search while simultaneously looking for precise characteristics, AI identifies more patients who would benefit from a particular drug therapy.

Novartis is also exploring how data and AI can support hospital decision-making and enhance patient treatment outcomes. In so doing, Novartis remains focused on what matters most: patient health.

To support these scientific uses of AI, Novartis is focused on digitization of workflow, company culture, and data, data ownership, and data privacy. This includes the legal implications of working with data globally, including complying with the rules and regulations of various countries, as well as the quality of the data.

As Novartis digitizes its workflow, it pays attention to its culture and people by continuously evaluating whether its culture is supporting the adoption of AI and other digital advances, and by highlighting agile concepts and enabling its workforce.

What next?

As it looks to the future, Novartis sees AI as a means to improve its drug discovery, clinical trials, and other business functions. As a leader in the adoption and business benefits of AI, and with its strong reputation for quality and compliance, Novartis is positioned to remain ahead of the pack in AI development and adoption within the heavily regulated pharmaceutical industry.

We have to get the data right in order for new AI developments to be useful. AI allows us to work faster, share information better, be even more patient-centric, and extend the reach of the services we provide.

Among the risks commonly associated with AI, the primary AI-related business risk is not adopting it fast enough.
Fast Forward
How to get started and take AI to the next level?

1. Choose a step-by-step approach in getting familiar with AI
Given the wide scope of AI and variations in use cases, it is key to start out by identifying what problems to solve and what opportunities to pursue. High level prioritizing between engaging customers, optimizing operations, empowering employees and/or transforming products and services adds clarity. Identify the problems you aim for AI to solve, prioritize the value with business owners, and acknowledge the capability gaps to get there. You need to get on the AI train, but do not jump on the AI wagon blindly. AI should serve your business plan, not vice versa.

Read more in the blog on LinkedIn about “AI for businesses: Not if, but when and how” by Michel van der Bel, Microsoft President, EMEA.

2. Display executive leadership and approach AI from a position of strength
Leadership comes from the top, also in the case of AI. For this to happen, executives must understand AI essentials and strategic perspectives, and they must communicate a clear AI ambition to the organization. AI leaders must actively sponsor and mobilize AI adoption on all levels, from the Board and Executive levels, through Management and the operational employees. Staying ahead in the accelerating AI race requires executives to make nimble, informed decisions about where and how to employ AI in their business. When doing so, look to strongholds before bringing in the AI ‘twist’. Amplifying existing company strengths is an excellent way to catalyze motivation and internal support.

Read more customer stories to see how others are using AI to transform their business, and learn from Microsoft Research on how AI is solving the most pressing challenges.

3. Hire new skills ahead of the curve – or focus relentlessly on training existing talent
A key challenge for putting AI to productive use and accelerate intended outcomes is the war for skills and talent. This not only relates to data scientists and software engineers, but also to skill sets and experience within human and behavioral science. Opting for a follower strategy and being late to the game can prove risky, as talent seeks to go where and how to employ AI in their business. When doing so, look to strongholds before bringing in the AI ‘twist’. Amplifying existing company strengths is an excellent way to catalyze motivation and internal support.

Read more in the Microsoft AI School about the open-source cognitive toolkit (previously known as CNTK) and how to help train deep learning algorithms.

4. Build a data strategy and technology stack purposefully fit-for-AI
Training your AI products essentially requires significant data. Useful data. Valid data. Establishing a solid data strategy and practice in your organization to proficiently acquire data, identify data, clean data, measure data, and manage data will ultimately make your organization flourish with AI. Build your AI resources around data engineers who organize the data, data scientists that investigates the data, software engineers who develop algorithms and implement applications. Make sure that your structure and governance harness the power of data, and that your technology stack across products, solutions, and applications nimbly enables your AI priorities. When doing so, remember that your business model is likely to change.

Learn more about how to build a flexible platform and portfolio of AI tools and next generation smart applications where your data lives - whether in the intelligent cloud or on-premise.

5. Beyond all, engender trust and enable human ingenuity
When designed with people at the center, AI can extend companies’ capabilities, free up creative and strategic endeavors, and help achieve more. Humans are the real heroes of AI – design experiences that augment and unlock human potential. Opt for a “people first, technology second” approach. This entails designing AI for where and how people work, play and live, bridging emotional and cognitive intelligence, tailoring experiences to how people use technology, respecting differences, and celebrating the diversity of how people engage. Thereby putting people first, reflects human values and promotes trust in AI solutions.

Learn more in the Microsoft Trust Center and the book ‘The Future Computed’ by Brad Smith and Harry Shum from Microsoft on Artificial Intelligence and its role in society.

Designing for people
At Microsoft we believe that, when designed with people at the center, AI can extend your capabilities, free you up for more creative and strategic endeavors, and help you or your organization achieve more.

The following principles guide the way we design and develop our products:

- Humans are the heroes. People first, technology second. Design experiences that augment and unlock human potential.
- Know the context. Context defines meaning. Design for where and how people work, play, and live.
- Balance EQ and IQ. Design experiences that bridge emotional and cognitive intelligence.
- Evolve over time. Design for adaptation. Tailor experiences for how people use technology.
- Honor societal values. Design to respect differences and celebrate a diversity of experiences.

Innovation is what creates tomorrow.

Learn about our AI platform to innovate and accelerate with powerful tools and services that bring AI to every developer.

Explore Intelligent applications where you can experience the intelligence built into Microsoft products and services you use every day.

Learn about AI for business. Use AI to drive digital transformation with accelerators, solutions, and practices that empower your organization.
